3     **ABSTRACT**

4         A surgical tool for doing work inside the body is powered by an electroactive polymer  
5     in the form of a transducer. The electroactive polymer is connected to an electrical  
6     power source and deforms from an initial position to a different second position upon  
7     electrical stimulation. The transducer can make a cavity in bone for internal splints or  
8     power a pump.
